## ***AquaSulis Softener Start-Up Procedure.***

\*before valves are opened and water is applied to the system.

Make sure both red by-pass valve arrows are crossed or closed before connecting pipes.

Plug in the power cord.

Follow the programming guide in the manual and set system time of day.

\*you can call us to help walk you through any additional programming if needed at 1-866-489-4004 ext 4

Add two bags of salt (minimum) and four gallons of water to the brine tank area.

Press and hold the REGEN button until you hear the motor start.

Advance the valve to the BW (Backwash Cycle) by pressing the regen button (only press once and wait for it to get to the next position before pressing it again)

Slowly open the right red arrow on the by-pass valve just until you hear water entering slowly. You can unplug the power and wait until water is flowing to the drain without air bubbles before plugging it back in.

When no air is heard through the water that is running to the drain, open both by-pass handles fully and plug the machine back in letting the machine continue to finish the cycles.

At the end of the day or before bed one could press and hold the regen button to start another cleaning. Hold the button until you heard the motor start and then let go.
